In the lm hosts file, I only have "192.168.1.32 #PRE #DOM:EPO". I'm not sure it is the reason or not because I demote all the DC back to member server and turn the backup BDC back to the normal. Thanks for your information. Hope I can smoothly migrate to Windows 2003 in next Sat. Thanks for your help.

"Vincent Xu [MSFT]" <v-xuwen@xxxxxxxxxxxxxxxxxxxx> wrote in message <news:Frt4FT0mGHA.5268@xxxxxxxxxxxxxxxxxxxxxxxxxxxx>

Hi,

After you disjoin the domain, can you ping DC1 & DC2 by netbios name & IP? Please try to ping either netbios name & IP and let me know the results.

I suspect it can be a name resolution issue and I suggest you check the lmhosts file. See following article:

180094 How to write an Lmhosts file for domain validation and other name resolution issues

<http://support.microsoft.com/default.aspx?scid=kb;EN-US;180094>

314108 How to Write an LMHOSTS File for Domain Validation and Other Name Resolution Issues

<http://support.microsoft.com/default.aspx?scid=kb;EN-US;314108>

BTW: I see another thread in this Migration queue and I suspect the two thread are talking about the same issue. Therefore, I'd like to work with you in this thread? Let me know if I'm wrong.

Thanks.

Best regards,

Vincent Xu

3. For your description: Those 6 PCs
CAN list DC1 & DC2 NetLogon or

Sysvol directory even I logon as domain Administrator. It said Access

denied. I'm confused. Please check the symptoms you listed and let me

know

Re: NT4 -> Win2K3 question

Re: NT4 -> Win2K3 question

if there are any incorrect.

Sorry, typo error. It should be "Those 6 PCs *CANNOT* list DC1 & DC2 NetLogon or Sysvol directory even I logon as domain Administrator. It

said

Access denied. I'm confused. Please check the symptoms you listed and

let

me know if there are any incorrect."

5. Try to dis-join one client out of domain and rejoin it to see the

results.

Tried. One of the PC dis-join the domain (change to join a workgroup,

named

"WORKGROUP"), then I try to re-join the domain. But it should cannot

find

the domain.

Hi,

I have following suggestions:

1. Change the dynamic update to nosecur & secure.
2. Verify if PDC emulator is working or you can install dsclient on

the

Re: NT4 -> Win2K3 question

Re: NT4 -> Win2K3 question

NT4

client.

<http://support.microsoft.com/default.aspx?scid=kb:en-us:288358>

3. For your description: Those 6 PCs
CAN list DC1 & DC2 NetLogon or
Sysvol directory even I logon as domain
Administrator. It said Access
denied. I'm confused. Please check the
symptoms you listed and let me

know

if there are any incorrect.

4. Try: ipconfig /flushdns
ipconfig /registerdns

5. Try to dis-join one client out of domain
and rejoin it to see the
results.

thanks.

I fail in my
last

Re: NT4 -> Win2K3 question

Re: NT4 -> Win2K3 question

migration
due to some
of the
computers
(Windows
NT
workstation
/w SP6) fail
to access
Windows
2003 server.
Do you
have

any

idea why?
Thanks.

Background

=====

We have
total 50 PCs
most of
them are
Windows
NT
Workstation
and the

rest

is

Windows
2000 in the
network.
All of them
get IP and
TCP/IP
setting

from

DC1

DHCP
server

We have 2
Win2003

Re: NT4 -> Win2K3 question

standard
edition
DCs. DC1
installed
DNS

integrated

with

AD and
secure
DDNS,
WINS and
DHCP.
DC2
installed
DNS
integrated

with

AD

and

secure
DDNS,
WINS and
printer
server.

We has 6
Windows
NT
Workstation
PCs has
problem.

Symptoms

=====
1. Those 6
PCs can get
IP from
DC1 DHCP
server.

2. Those 6
PCs can
logon to the
domain

Re: NT4 -> Win2K3 question

Re: NT4 -> Win2K3 question

3. Those 6
PCs can
ping DC1
and DC2.

4. Those 6
PCs can list
DC1 &
DC2
NetLogon
or Sysvol
directory
even

I

logon

as domain
Administrator.
It said
Access
denied.

5. Those 6
PCs do not
run the
logon
script. I
believe it is

because

those

PCs cannot
access
DC1/DC2
NetLogon
directory

6. After
change
DNS
integrated
with AD
and secure
DDNS,
only few

PCs

name

and IP
address
show in the
zone under
Forward
Lookup
Zone.
