

Moving home folders still have old permissions

Hi. I'm not really versed in the ways of AD as I'm doing my first migration to 2003 from NT. I have installed 2k3 on a separate server with ad, dns, dhcp. I have set up the trusts to my other 'messy' domains and have gone as far as using ADMT to migrate a couple of users and groups over...so far it's looking good.

Now I wanted to move some folders from an old file-sharing NT BDC (running out of disk space).

So as a test I decided to copy the 'migration test-user's' home folder which only had permissions for Administrator and the Test-User of the old NT domain. So I used robocopy with the /SEC switch to copy it across to include permissions. It copied fine, but when I checked the permissions, the Administrator account was the one on the NEW domain, but the Test-User was the user SID of the OLD NT domain. Fair enough, but what would happen when it comes to decommissioning the old domain? Would I need to do some kind of XCACLS job to get it right for all users, on all folders? or is there an easier way? Maybe I'm missing a vital step in migrating users.

Any help would be very much appreciated, thanks.

TJ
