Dear Customer,

Thanks for posing here.

Firstly, after viewing your post, I understand that this issue isn't a small project, which is associating with AD, SQL and Exchange upgrading. Here, we mainly focus on break-fix issues related to Windows server migration. For more effective and guaranteed solution, I would like suggest you contact our advanced services at:

<http://support.microsoft.com/gp/advisoryservice>

The Microsoft advanced services provide remotely-delivered and consultative support option that adds the element of proactive support, and provides a comprehensive result beyond your break-fix product maintenance needs

However, I am also glad to provide you my analysis and suggestion for your reference:

Analysis and Suggestion:

=====

1. "When i go to adprep the domain, will that mess with anything? From KB article (<http://support.microsoft.com/?kbid=325379>) it says to "Scenario 3: The Windows Server 2003 forestprep command was run without first running inetOrgPersonFix" do i still need to do that since that messes with exchange 2000 "stuff" that was left behind?"

[Morgan]:

The propose of running "interOrgPresonFix" to avoid the mangle of three attributes: houseIdentifier, labeledURI, and secretary. But if our real environment belongs to one of the following cases, we do not need to run this command.

o If you run the Windows Server 2003 adprep /forestprep command in a forest that contains the Windows 2000 schema before you add the Exchange 2000 schema.

RE: First Windows 2003 domain controller

- o If you install the Exchange 2000 schema in forest that was created where a Windows Server 2003 domain controller was the first domain controller in the forest.
- o If you add Windows 2000 inetOrgPerson Kit to a forest that contains the Windows 2000 schema, and then you install Exchange 2000 schema changes, and then you run the Windows Server 2003 "adprep /forestprep" command.
- o If you add Exchange 2000 schema to an existing Windows 2000 forest, then run Exchange 2003 /forestprep before you run the Windows Server 2003 adprep /forestprep command.

Therefore, it's preferred to consider the upgrade path complying with one of the above situations.

2. About the issue of Exchange and SQL upgrade, I am sorry that we are not best support resource for them. The microsoft.public.windows.server.migration newsgroup mainly focus on the migration of Windows Server products. To ensure these issues receive full attention and more professional support, I suggest you opening the new posts in the below newsgroups:

For the Exchange upgrade:

Microsoft.public.exchange.setup

For the SQL upgrade:

Microsoft.publi.sqlserver.setup

Microsoft.publi.sqlserver.server

3. " Also this is a new domain not an upgrade. Does anyone have any instructions to follow for such a thing other than the previous KB article that is for upgrading from windows server 2000 to 2003 but adding a brand new server?"

Please refer to my colleague David's reply in the below link, which will provide you a relatively detailed steps about how to add Windows Server 2003 Domain Controller into the Windows Server 2000 domain environment:

<http://www.microsoft.com/technet/community/newsgroups/dgbrowser/en-us/default.aspx?&guid=&sloc=en-us&dg=microsoft.public.windows.server.migration&p=1&tid=dc91213c-fbc5-4d1a-b76b-ded87446859b>

I hope this helps. If anything is unclear, please feel free to let me know.

Have a nice day!

Sincerely
Morgan Che
