Hello Laurent,

Thanks for your reply.

According to your description, here are some options which may be helpful to remove this 2 objects.

Option 1.

Please try enabling the following registry both on parent and child domain controller to force replicate again.

HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Services\NTDS\Parameters  
Value Name: "Allow Replication With Divergent and Corrupt Partner"  
Internal Name: DRA\_OVERRIDE\_TOMBSTONE\_LIMIT  
Value Type: REG\_DWORD  
Value Data: 0x1 (enabled)

Option 2.

Use the "repadmin /removelingerobjects" tool to remove inconsistent deleted objects and then resume replication again.

Note: the support tools is need to be installed on the domain controller firstly. The support tools is in the Windows installation Disc.

Option 3.

If the options above doesn't work, please just use "ADSIEDIT.MSC" utility on both parent and child domain controller to manually remove the 2 objects.

Please locate the 2 objects with LDAP path you provided and then remove them.

Hope the issue will be resolved soon. I'm looking forward to your reply.

Thanks a lot.
