We have a Novell eDirectory with file, print....GroupWise... Zen works the whole shebang it works wonderfully. We just no longer have the resources to support this. We also have an Active Directory tied to eDirectory through Novell IDM. We want to migrate our file server and print servers over to windows. We need to keep our current rights to files and folders. I don't believe I can use Quest or MSDSS services as we already have a working Active Directory and user's already exist in it with Microsoft file and group associations.

How do I go about moving my Netware files and folders from Netware 6 to windows 2003 and maintain rights?

.
