I have a couple of Windows 2k3 servers that are members of an old NT4 domain. One server is hosting member home directories. I want to migrate this server to an AD domain we have in house. This new AD domain is not in any way trusted with the NT4 domain. The users in these domains have the same usernames on each.

What is the procedure to accomplish this and are there any hidden gotchas. I am assuming that the security properties will need to be redone on the user home directories. Do I have to install any new software on the 2k3 server?

Thanks,

G
