I'm new to this newsgroup and to Windows 2000 Server technology, but have worked several years in designing websites and some CGI programming, so am not a tech newbie. I work parttime for a small business and have been asked to find a way to share program files over the internet (i.e., allow users in another city to access shared data files on our server, instead of emailing files back and forth). We use Windows 2000 server, but so far has only been used for file-sharing. We have a firewall (Watchguard Firebox).

My question is: what is the best way of doing this? I'm told using VPN technology would do this, but I'm just not sure where the best place to start is and what exact technology I should use. This will not be large-scale; only 2 or 3 people will need to access the program files remotely. What would be the simplest, but secure, way of doing this?

Thank you in advance for your time,

James Kennedy
