Your response is correct but does not solve my problem.

Firstly if I do just re-hit ctrl+alt+del each time it does go away but it then often takes an extended amount of time to complete the logon process so does not save time overall and sometime it will just not logon at all.

It seems better to wait for whatever it is doing during the "Please wait..." and then logon normally.

More importantly I did not have this problem in the past. And now that I do have it Syamantec Ghost also seems to have problems automatically joining imaged clients to the domain – so I suspect the issues are related.

Thank you for your response but I would like to get to the bottom of what is actually occurring.
