Thanks, Steve.

Let me make sure I understand your point clearly.
We have Remote Client---VPN--- Server to Access.

I always used the credential to log on to the VPN who has proper access privileges to the Server, though a different credential was used to log on to the remote client.

On the same Server we have several shares which the VPN user has access. Interestingly, the user can access some but not others, though it has full access to all shares if logged on to a machine on the LAN.

Thanks again.

Frank
