Hi there.

I recently had the same trouble on our network and came within a week of losing my job. Whenever I would hack registries and lower my MTU, things began to work. But as it turns out, the entire problem was due to a Windows 2000 Server automatic update. This update was also given for XP, and Win2k3 Server. The update was a reinstall of the TCP/IP stack files in order to seal a security hole. That update broke our entire network. It was because of devices with differing MTUs and a LAN/WAN environment according to the MS KB article. To us, the problem surfaced as RDP/Terminal Services just giving a black screen, SQL Database replications and DTS packages failing, Active Directory replication failing, email failures, and other weirdnesses. The url to the Windows knowledge base article is here if it will help you: "<http://support.microsoft.com/kb/898060/>? – but again, I can't be responsible for what you do, blah blah blah, cover my butt, etc. If it saves you from any more heart-ache and late night caffeine binges, I'll be glad to have been of service.

Thanks,

–Isaac Morton
