We have a Win2003 Active Directory. The DC hosting the PDC FSMO is the primary NTP time source for both the Windows network (by default) and the non-Windows servers. We are troubleshooting a few minor problems on the non-Windows side.

How can we confirm that NTP is active on the DC? Port scans show that port 123 is not listening. Also, telnet'ing into port 123 fails to connect. Any suggestions?

J Wolfgang Goerlich
