- 

Hi,

I keep getting this message on the domain controller. Everything else seems ok on this server. Could these messages belong to some other workstations on the network? The following is the error, where is the ip address that I need to look for.

thanks

Roger

A duplicate name has been detected on the TCP network. The IP address of the machine that sent the message is in the data. Use nbtstat -n in a command window to see which name is in the Conflict state.
