Hello All,

I am using a Dell PowerConnect 5324 (24 Port Switch) and I have connected that to my PC which is running on the Windows XP. I am trying to make some changes in the settings of the Switch (to be more particular : Changing the Spanning Tree State from Enable to Disable), then I hit on the 'Apply these changes' button at the bottom of the page; I reboot my system and I find that these changes are not saved. So each time I reboot my PC and Switch, I don't see the changed settings saved and its is annoying. Please help.  
My PC and the Switch are connected in the same subnet

Thanks.

.
