I had set up a VPN server using Win server 2003 and I would like to share files using this server. I need to share the files for two remote client computers operating under Win XP. Both computer can dial into the vpn server, however when coming to sharing files, it happens that only one user can access the files at one time, which means when user A is accessing the share files, user B cannot access the files although it is connected to the server through VPN. Why is it so? How can I solve this problem???

Thank you for the answer!!!
