Use portqry.exe to tell you if it's listening on tcp 3389.

For some reason simple RDP or Terminal Services will not connect to one particular server (not running licensed TermServ – just std version) whereas I could before. I can terminal serv to another server from this one unavailable server but cannot connect to it from any other server on the network, nor remotely from home.

The knowlege base doesn't give any good answers whatsoever.

Connecting via Terminal Services get "The Terminal Server has ended the connection"

Trying with Remote Desktop I get "The connection was ended because of a network error"

All TCP/IP is correct, DNS is correct, and all network connectivity with applications, etc. are all just fine. Everything works and has worked without issues with the exception of simply trying to TermServ to this particular server in question.

I had this problem long ago and fixed it but cannot for the life of me recall what I did nor did I document it (shame on me I know!!!)

Any help would be appreciated.
