I am looking for a way to get a list of all logged on users, their computer names, and IP addresses on our LAN. I was using AngryIP <http://www.angryziber.com/ipscan/> but it doesn't seem to scan past the client-side firewall in Windows XP sp2. To be more specific, Angry IP scan results show the IP and computer name but NOT the username for any WinXP computers with sp2. I'm uncertain about the continued development of that great little utility. Optionally, I have looked at the Shares plug-in in MMC but that does not seem to have this info. Also, ShareWatch <http://www.stevemiller.net/sharewatch/> works but generates too much info for my needs. I really just need username, IP, and computer name in a simple format like AngryIP. I use AngryIP to get my usernames and LAN IP, then I VNC the computer to offer user support. Very handy. Suggestions? Thank you.
