I don't think he means a local account on the server, I think he means a domain account.

If that is what is being requested then there are not a lot of good options.

You could use a terminal server to log into and change your password that way.

You can utilize the old IIS change password pages
<http://support.microsoft.com/?id=331834>

Or you can make a custom bunch of pages. VS 2005 has some great new objects for just this kind of functionality.

Or purchase a 3rd party product.

Or you could just join the computer to the domain.

Hi,

how can I remotely change user password on Windows 2003 from workstation with Windows XP, when this workstation is not in domain?

Thanks for advice...

Re: Windows 2003 – change password remotely

You could do the following from your workstation:

```
net use \\<workstationname>\ipc$ /user:<workstationname>\administrator *
```

Give the password.

Then you go to manage computers snapin and connect to the specific workstation and change the administrator account. This should do the trick.
