Just on the off chance that you are trying to connect to the admin shares (i.e. \\host\c\$) be aware that XP Home Edition does not have any admin shares. You have to create shares yourself first to be able to connect.

All shared folders are in Win XP. Win 2003 only act as DNS, DHCP, RRAS server. Firewall is on with exception on File and Printer Sharing.

Permission

checked. Ping works fine either with host name or ip. XP able to see all the

comp on the domain. But, when double click to access the computer (in order

to see shared folders) the error msg is given. Sigh.. What happen??

"Anton Pegan" wrote:

Hi,

Usually the default settings allow domain users to access and share folders.

First you have to check the firewall settings or antivirus programs, they have to allow File and Printer Sharing ports. Check the permissions on the

shared folders. Which machine has the shared folders; XP or 2003? Does this

happen on all machines that share the folders? What happens if you try to ping the machine that has the shared folders?

Regards,

Anton Pegan
