gpoutil – no errors
dcdiag – no errors
netdiag – no errors

but still every 5 minutes userenv events 1097 and 1030. When I try gpupdate I get the same events. Any idea?

Regards
Holger

thanks for your response, I have already checked most of the knowledge base articles, but without any success. I also think it is related to DNS settings, but how can I fix it?

Maybe the following is helpful: when I run the "Group Policy Modeling Wizard" in the Group Policy Management I get errors when using the site "default-name-..." but no errors when using site "none". The errors are "Component Status, Component Name, unknown error reading group policy".

Regards
Holger

I would check the DNS settings first. Or these search result may help,

Event ID Troubleshooting Event ID 1053 – Userenv Event ID 1054 – Windows cannot obtain the domain controller name for your computer network. Event ID 1058, 1059 and 1030 ...

www.chicagotech.net/wineventid.htm

Event ID 1058, 1059 and 1030 Event ID 1058, 1059 and 1030. Event ID 1058 is Group Policy related issue. Normally, there are two symptoms: "network path not found" and "access denied". ...

Hi,

I receive the following events in the event log every 5 minutes on a single Windows 2003 with Active Directory and domain controller installed:

Event Source: Userenv

Event Category: None

Event ID: 1097

User: NT–AUTORITÄT\SYSTEM

Description: Das Computerkonto wurde nicht gefunden, Der Anmeldeversuch ist fehlgeschlagen. . (Windows cannot find the machine account)

Event Source: Userenv

Event Category: None

Event ID: 1030

User: NT–AUTORITÄT\SYSTEM

Description: Die Abfrage der Liste der Gruppenrichtlinienobjekte ist fehlgeschlagen. Überprüfen Sie das Ereignisprotokoll auf frühere Fehlermeldungen des Richtlinienmoduls, die die Ursache für dieses Problem beschreiben. (Windows cannot query for the list of Group Policy objects).

Any idea what is going wrong?

Regards

Holger
