hi all,

i'm trying to set RRAS in order to communicate via VPN two our offices in different places. I was able to do a nat without problems, so that 2 networks (VPN and local) can see each other from clients of networks. till now, no problem!

well, now i need that clients can connect to a FTP situated on VPN network. From server RRAS i can without problems, but from clients nothing! :-(

I know that i missed some steps and for this i ask some tips to you.

Network configuration is very simple, i don't have neither proxy and firewall..... only a router.

Thanks

.
