Chris,

Thanks for your help. (Everything I read pertains to large networks with more than one server and it gets confusing.)

My clients are statically configured. I will get the Gateway, Primary DNS, & Secondary DNS from my ISP and setup each computer on the network.

Thanks Again I just was not sure about the next step.

Bill

Chris Lehr wrote:

This is a very broad question.

In short, you will need to turn on the router to be an IP of 192.168.19.something

If clients are statically configured with IP's – you will need to manually add the above IP as their default gateway, and add the ISP's DNS servers.

If Dynamically configured IP addresses, you can change these settings on whatever device (or server) is performing the DHCP function.

Hope this helps,
Chris

Hi All,
I need some Help! I have a 2003 R2 Std Stand Alone Server with 11 clients
