I have a 10\100 Lan which has over 30 pc connected to it.

My company are considering adding 10 ip cameras and monitoring the site and factory, my question is can any one see any problems with this and possibly point me in the direction of the best cameras to use.

My main concern is the traffic created by these cameras slowing network and stopping users from working.

the cameras will be running all the time and video will be recorded for future use.

If any one has any advise whatsoever it would be much appreciated.

Many thanks.
