Hi,

I have a site with multiple VLAN's (say 10,20,30 for example). I wish to setup a DHCP server on an existing windows 2003 box that can give out IP's to clients on any of these VLAN's. At the moment the server is sat on VLAN 10 and there is a checkpoint firewall providing the routing between the VLAN's. Whats the best way to setup DHCP on the server so it can work in this way? Is superscopes the right way? Or is there another, better, configuration?

Thanks for any help
