There is a folder (with its subfolders) that I can access now, but I can't open the files. I get this message.

There was an error opening this document. Access denied.

I just discovered that I can open a document if I give the Administrator ownership, close the properties box open it again, then give Everyone permissions, then I can open the file. But there are over 18,000 files under the main folder so it isn't practical.

Different subfolders have different property settings. I can't explain it. I can jump around and find that some folders are accessible as well as some files. Some permissions are editable and some aren't. One folder has all of its properties check, but some were disabled. When I clicked on the enabled checkboxes they became disabled but still checked.

It doesn't make sense but it is what I am dealing with.

Thanks for your help and God Bless,

Mark

I'm not sure I understand the problem, but did you also check the box to reset permission on child objects?

What exact error are you getting?

Anthony,

I was logged in as Administrator. I did take ownership to get the

Re: Oops not resolved

ability to add users back onto the list and set permissions. The userlist now includes the Administrator and Everyone. All permissions are issued including full control. Some subfolders are accessible, some aren't. Some files are accessible and some aren't. No files (.pdf) will open. This is what is bizarre.

I have deleted files and folders that others have created. I am an administrator and should expect to. But this problem doesn't seem to be subject to any rules or rationale.

Thank you for your response and God Bless,

Mark A. Sam

It is less bizarre than it seems.
The Creator Owner can only delete stuff they create or own.
As administrator you can over-rule by taking ownership and then setting the permissions.

I got permissions set on the main folder, but a couple of the subfolders are denying me permission, even as Administrator, and some of the files are being denied in the folders that I can access.

I know little about this stuff, but it seems bizarre. It also seems irrational that the Administrator can be denied permission, yet if a new user is added, he has permission to delete folders and can wipe out valuable information. Am I wrong in thinking that an Admin should have all rights, and a new user no rights until they are granted?

Hello,

I recently set Special permissions on a folder and its subfolders to Deny Delete and Deny Delete on Folders and Subfolders. The only group listed was Everyone. After that, I think someone else unchecked Full Control and Modify permissions. Either that or they unchecked themselves. When I rechecked Full Control and Modify, they showed up in the special permissions section. Then I removed all special permissions thinking I could just start over from scratch, but the group Everyone had disappeared and no group listed.

Now I can't add a group and can't access the folders. How can I fix this? The server is running Windows 2003 Small business edition if that matters.

Thank you for any help and
God Bless,

Mark A. Sam
