

Re: Puplic IP changed

IP, but I wouldn't bother – fix this once so you have an easy to remember name.

Your existing remote clients will need to modify their settings. I don't use the VPN wizard stuff, so I don't know what they've got (I'd personally have them use Remote Web Workplace instead of VPN, and if they did need VPN I'd walk them through setting up a connection manually). Try posting in microsoft.public.windows.server.sbs for more help. In fact, that's the best group for all your SBS questions – SBS does many things its own way.

Thanks for the info. Yes, I realized the benefits of an A record last night and set one up. If I cruise through the CEICW wizard are all my previous settings remembered?

Yes – you don't change anything you don't need to change (you get the option to ignore existing settings, etc)

I just replace the IP with the new domain name when I get to the appropriate spot and a new cert is created when completed?

Yep – change 123.123.123.123 to blah.mydomain.com.

Yes, I do use the RWW but I can't get through that wizard to create a new package. Apparently there is a know problem where the wizard hangs at the end. I upgraded to the SBS SP1, and the first step of that is to install WinServer 2003 SP1. Some of the posts I've seen have seen said to uninstall the Win2003 SP1 to solve the problem of the hanging wizard. But they don't say if the SP1 is no longer needed after the complete SBS SP1 installation is complete.

You should try posting in m.p.windows.server.sbs, really.

And, will uninstalling Win2003 SP1 require a reboot?

Oh, don't do that.

I only have a handful of clients and it might be easier to just set up the VPN instead. I'll look over in the SBS section for some of these answers.

Re: Puplic IP changed

Re: Puplic IP changed

Yep. I personally don't see much need for VPN....RWW so that they can do remote desktop to a TS or WinXP box is a lot easier to manage.

Thanks...

Len
