I've lots of desktop experience as an IT Technician in peer-to-peer and home user environments but I'm a bit of a newby to servers having only worked on a Win 2K domain server with a handful of clients several years ago and I've no Win 2003 Server experience at all.

A small business has contacted me, they have a Win 2003 Server which they use basically as a desktop PC with a shared folder, and eight client PCs most of which are Windows XP Home. I want to set the server up so that it authenticates users logging on to the network because they want employees to be able to log on remotely. I believe that Windows XP Home PCs can't be joined to a domain and therefore will not be able to access the shared folder after I do this, am I correct?
