Hi, I have a windows 2008 server (sorry, I know this is a Server 2003 newsgroup but I cannot find a 2008 one) running RAS with VPN and NAT enabled.

When clients connect to the network via VPN they can access the internet through the server without any problems, but local clients cannot.

The server connects to our private network on Local Area Connection, static IP 192.168.1.1, subnet 255.255.0.0.

The internet is connected on Local Area Connection 2, IP 192.168.1.10, subnet 255.255.255.0 gateway 192.168.1.254.

DHCP ranges for local clients are 192.168.1.11 – 192.168.1.30 with default gateway set to 192.168.1.1.

The server also runs DNS with forwarding to the ISP and DNS lookups are working correctly from all machines.

Its using the default settings for the IP routing table. What else do I need to do to allow client computers on the private network to route to the internet?

Thanks in advance for any help on this.
