I finally got it!!! I might have neglected to mention before that this is also an ISA server. I didn't really think anything of it since all of this traffic was internal. However, as soon as I added a rule to allow NetBIOS and RPC to the localhost – I was in! I guess the firewall locks those down by default. Thanks to all the posts and patience.

Yes, I can ping localhost. I can also ping any other device by name from the box in question. I'm willing to bet the problem is that it is multihomed – I just can't figure out why it is not registering with DNS on the internal side.

Thank you,
Robert Brown
