Go to the client and look in the %windir%\debug folder and send the netsetup.log. For the accounts that you are using to join on, were they created through the Add User Wizard? Did you create computer accounts as well? From the client machine, can you ping both the server name and the server's NetBIOS? If all of that seems correct, did you modify the network card on the server that you are using for the internal network? If so, check the bindings of services to this NIC and make sure that they allow file and print sharing to this NIC.
