Dave,

I don't think so. I have the packet filter open for UDP 123 traffic.

I think it is permissions related.

W32TIME runs under the local system account. I believe that ISA will not allow anything through that runs under local system. Changing the logon name for the service doesn't work: generates an error message.

There is a knowledgebase article that talks about changing ACLs on the proxy server. It reads like it is for Microsoft Proxy Server 2.0 so the article has not been updated for ISA (don't Microsoft ever test out what their Kb articles tell us poor dumb users to do?). As I said, I can't find how to change the ACL in ISA to do the same thing as MS Proxy 2.0

Any thoughts?
