howdy all,

in Day 2 of my migration, and things are going tolerably well, thanks to some timely input from this group!

I am having a couple of minor issues with Exchange, but I have enough documentation to slog through them, I think. What I do need some input on is Remote Desktop.

We are going through a firewall that routes incoming traffic by port to the correct hosts. While I am able to Remote Desktop the server from inside the company LAN, I want to find a way to enable someone to get in via an Internet connection. Checking netstat while running Remote Desktop showed me that it's not using any specific ports but grabbing random ones.

My question is how can I route traffic to allow an outside user to access Remote Desktop?

Thanks for any input, and while I'm waiting I'm going to wade through hip-deep stacks of Exch 2003 docs...
