Running SBS2003 Premium with the new Disk 3

Installed SBS2003 completely, did nothing else. Then installed ISA2000

Get errors trying to configure monitoring. I only get a successful check mark on Configuring Data Store. I get a failure on Configuring Data Collection, Alert Thresholds, and Reports.

On the Company Web site.... When I click on Site Settings or Help, it asks for credentials, which eventually fails to the error message below. On the company web site, on the top right, there is an error message saying Web Part Error.

Here is the error message after the credential fail.....

Server Error in '/'_layouts' Application.

Runtime Error

Description: An application error occurred on the server. The current custom error settings for this application prevent the details of the application error from being viewed remotely (for security reasons). It could, however, be viewed by browsers running on the local server machine.

Details: To enable the details of this specific error message to be viewable on remote machines, please create a <customErrors> tag within a "web.config" configuration file located in the root directory of the current web application. This <customErrors> tag should then have its "mode" attribute set to "Off".

<!-- Web.Config Configuration File -->

```
<configuration>  
  <system.web>  
    <customErrors mode="Off"/>  
  </system.web>  
</configuration>
```

Notes: The current error page you are seeing can be replaced by a custom error page by modifying the "defaultRedirect" attribute of the application's <customErrors> configuration tag to point to a custom error page URL.

```
<!-- Web.Config Configuration File -->
```

```
<configuration>  
  <system.web>  
    <customErrors mode="RemoteOnly"  
defaultRedirect="mycustompage.htm"/>  
  </system.web>  
</configuration>
```

Any help is appreciated. It appears everything else appears to be working.
