Ok Not knowing exactly what you are doing I'm taking a shot in the dark let me see if this sounds good.

Run Smoothwall Firewall. (Free at [www.smoothwall.org](http://www.smoothwall.org))  
Put Three Network Cards in it.

Open DMZ to your Webserver (Red Hat)  
Use that to connect internally to your SQL server. (Then you'd be on the 100MB/sec Side of your network.)  
Open an Port to From Webserver IP to SQL IP.  
Keep everything else behind the firewall.  
Then you have control of your webserver and fast throughput to your SQL server.  
The SBS will be behind the firewall not exposed and the SQL server will be safe..

You could also run Two Firewalls if you are really worried about security.  
One before the Webserver.. Then the Redhat Server then an Internal firewall then you net.

Does that make sense?  
Russ
