I installed SBS2003 & everything went fairly smooth, email working ok, then a few days ago I noticed in outlook on client pc's that they can no longer connect the Exchange.

Looking through the server performance report, there are several critical errors in the application log, MExchangeSA, The MAPI call 'openmsgstore' failed with the following error: The Microsoft Exchange Server computer is no longer available. Either there are network problems or the Microsoft Exchange Computer is down for maintenance. The MAPI provider failed. Microsoft Exchange Server information store ID no: 8004011d-0525-00000000

Also MExchangeDSAccess Process MAD.EXE (PID=2452). All Domain Controller Servers in use are not responding:

MExchangeFBPublish error initializing session for virtual machine

MExchangeSA DSACCESS returned an error'0x80004005' on DS notification. Microsoft Exchange System Attendant will re-set DS notification later

MExchange IS Error starting storage Group

MExchangeAL LDAP Bind was unsuccessful on directory

MExchangeAL The WIN32 API call 'DsGetDCNameW' returned error code [0x862] The specified component could not be found in the configuration information. The service could not be initialized. Make sure that the operating system was installed properly.

Re-booting is no help. before these errors occurred it was running fine. At the moment we collect email using the Email accounts wizard in outlook 2003 on each client pc.

If I have to Re-install SBS2003 where do I stand with having to activate it again & will the new install of SBS2003 pickup the emails that have been downloaded onto client pc since Exchange went down.

microsoft.public.windows.server.sbs: MExchange no longer running

Has anyone got any ideas on what has gone wrong or am I going to have to re-install SBS

Thanks

Bernard George
