Use Remote Web Workplace to access the company Web site from the Internet.

To access the company Web site through the Internet, you need to publish the site to the Internet. To do this, it is recommended that you use the Configure E-mail and Internet Connection Wizard. This will ensure that the proper permissions are set to allow only authorized users to access the Web services.

My domain name is www.knightech.net, how can I go about publishing my server or company website on the internet. Is www.knightech.net what I would use to accomplish this or another way. Please someone help me out!!

Thanks so much

David Gomez,
