Hi all,

I have the suggested setup running for SBS2003, two nic's one Lan the other going to a Belkin Nat router and then to a Cable Modem.

Dynamic IP address, ISA Server etc.

When I log-in to the Router config web page from a firewall client machine, it can take up to ten minutes for the password to be verified and some screens sometimes do not login properly, i.e. deny access.

I have tried all the usual; checking LAT, putting in the web address of the router in the IE proxy bypass settings etc.

Also, I have the same problem but much worse with a Belkin Wireless access point.

Any suggestions?

Thanks,

Dave
