Someone's doing a port scan on your machine...there's nothing you can do to stop that. If you want to stop receiving the notices as often, if you right click on "Packet Filters" in the ISA MMC, you can set the thresholds for when it will e-mail you, or you can turn that off all together.

Isn't the internet safe and fun?

If ISA's notifying you, and ISA's properly configured, and the server is patched, I wouldn't worry about it.
