I have this problem also, to all of the machines except 1. I can connect to 1 machine but the rest give me that error. I am not running the ISA firewall. The only Firewall I have is a Cisco Pix 501 between the Internal network and the Internet. Because I am connecting from the Internet, do I have to open that port on the Pix? I thought the communication was between the Server and Client that the port needed to be open, and since it does work to 1 PC (They are all brand new and the same) I assume that is not the problem.
