I am performing this test from a newly formatted and installed Windows XP Pro machine with all of the Windows and IE patches and updates installed.

I can sign into the RWW and access OWA and see my Inbox just fine. However, when I click New to create a new message, a new message window pops up and loads with Errors on Page. The details when I click on the exclamation point are –

Line: 82

Char: 36

Error: 'g\_fLoadComplete' is undefined

Code: 0

URL:

<https://mail.reflek.com/Exchange/Administrator/Drafts/?Cmd=new>

I can type the email and hit send, but the Windows of the Email just turns into another window of my Mailbox like the one that is already open, and nothing goes into sent mail.

If I try to reply to a mail, the same thing happens, but the URL error is

URL:

<https://mail.reflek.com/Exchange/Administrator/Drafts/?RE:%>

However when I hit send on a reply, the left hand side of the Window turns into the Folder List, but the right hand side remains the Reply Message, ready for me to hit send again.

If you ever saw on a PC when you tried to run Windows Updates, and when you clicked Review and Install updates and it would open another Update window inside the original one, creating a hall of mirrors effect, this is

microsoft.public.windows.server.sbs: Can't send Email in OWA on a 2003SBS

kind of what it looks like when I reply.

Any ideas? And Thanks Ahead!!
