Hi.

I have a DELL 1600SC with MS SBS2000 SP4 installed.

My system worked fine, but after few days, i realize the switch's LINK/ACT leds started to blink, and never stops.

Even i reboot the server, the switch immediatly start to blink again.

I think it happened after i configured the domain on the server and clients.

Could it be the cause?

Please, can somebody tellme how can i detect the proces or the machine who is sending traffic on the net.

Is there a tool or utility to find and kill that process.

TIA.
