Hello all,

After fours days of pulling my hair out I thought I would ask the experts...

I am trying to setup a secure VPN connection using L2TP/IPSec... I am running (all on one box for now) SBS2003 standard, IAS, CA, DNS, RRAS....

I can enable remote access IPsec policies and have managed to get certificates on the client machine to work for IPsec... what I cannot seem to accomplish is to get a computer certificate to install that will work for the L2TP tunnel...

I can install certificates through the CA web services interface but cannot get a Computer certificate to list as a option.... when I try to request certificates manually through the MMC cert snap-in I get "the certification authority cannot be reached. Please try again later". when on the server I can use the certutil.exe ping and ping admin verbs and get succesful responses...

oh the client machine is a fresh install w2k with all the patches installed... it connects when I do not require L2TP tunnel type...

here's hoping someone can help me!

Thanks!

Gered
