There will not be any practical way to make use of the Outlook 2003 filter rules because this is client side. You could install the Exchange 2003 SP1 with IMF as recommended by Gary to reduce your spam, you may also want to consider configuring connection filter to block black listed servers.

Although the above will help reduce the spam, using a duplicated external account is not the best way of achieving this e.g. any emails he deletes on his office workstation will appear again in the external account etc. What type of mobile phone is he using ? There are a number of VPN applications available for various platforms such as Symbian which he could VPN into the server on, and then pickup his mail direct from your server. Failing that, if his cell phone has a web browser, he could use OWA-Mobile which would also give him access to his mail directly on the server.
