Hello John,

"Slow" as in...?

Has this ever worked properly?

How much RAM is installed on the server?

Does this occur to all clients or just some?

Did you join the clients to the new domain?

Are there any applications being run on the server that are using an overabundance of CPU cycles?

Have you scanned all client machines and the server completely with an anti virus package?

Make sure you have run the CEICW on the SBS 2003 server.

Verify all of the clients are pointing to the server for DNS and WINS and can ping the server by IP Address, FQDN and NetBIOS name.

Regards,

Mike Lieser
