1. SBS does not work in a peer-to-peer,; you need to be setup with a domain and Active Director,y which SBS does automatically, and nicely, if you follow the wizards
2. Yes, you can setup a domain even if you have a dynamic IP address with your ISP/Internet provider. Saying that, you are strongly encouraged to spend the extra \$20-30 and get a second NIC card. This 2nd NIC would be connected to your Internet connection, while your first NIC would be attached to the same hub or switch with your other computers
3. If you follow the SBS wizards, DHCP is automatically configured. However it is very important that if you have a DSL/Cable router attached (between your server and Internet connection), that you verify that DHCP is turned off on that router.
