I am running Win Server 2000 currently as a web server and file server for a small office. I plan to migrate to SBS 2003 soon. I plan to do a clean install of the new OS because my server was used for alot of software development work and likely has alot of bad stuff lurking on the drive.

The server is running as a domain controller (probably for no good reason in the past) and manages four client accounts in AD. How can I back up that account info such that when I install SBS I can add back those accounts so that each of the client computers/users can log on easily to the new environment?

Thanks,
Bruce
