Guys,

I setup an FTP server inside of IIS. It works great on the network. I can test by looking to the local server and try my accounts and everything is great. I try it offsite and I get a error that says you may not have permission to access these files. I have tried everything. I have rebuilt the FTP several times. I have tried different FTP clients. I did find one article that says something about log on locally but one of the accounts that I am testing with is the domain admin and also in the administrators group. I can see in the logs that an account login was attempted but denied. I have set the router up to open the DMZ and proved that it is not a firewall issue.

Next thing I did is VPN in and then go in remotely across the VPN and it works great. Has anyone got any idea what is going on. Is it a log on locally problem? If so how do I get past this. Thanks,

Brad Wilson
