Hi Marina,

I don't know why SBS won't report the gateway as a uPnP router but then I haven't figured out what a "Hybrid" or an "Unknown" node is either. :)

WINS was set up by the CEICW Wizard but I can go in and manually turn off WINS.

But the issue isn't internet connectivity but rather a single workstation that appears to have failed to complete the CONNECTCOMPUTER task. The user's profile was not migrated and there were several other issues with the final result.

There were a number of workstations to connect on a single day and there was another person involved in doing this.

I'm merely trying to follow up and determine what went wrong so that I can have a reasonable chance of success in getting the workstation connected properly. As it stands, we've had to revert to the local computer account and connect to SBS as if it were a member server. That's OK as far as it goes but it's not where we want to be.

Thanks for the come-back.

Adam
