It is Standard with 2 nics. When I setup the machines using the connect computer wizard I got a message stating that I am not authorized to view this web page. I added each machine by changing the domain name etc through properties of my computer.

I do not understand what you mean when you say "To enable it you need to have selected it when you ran CEICW". What "it" are you referring to?

The other issue is the fact that we do not have the licenses to install the software onto multiple systems. We installed it on the server because it has excess processing power and disk space. The only spare XP Pro WS is a lot weaker when it comes to processor etc.

Currently we can use remote desktop connection to allow 2 users at a time into the app, but we have 6 people who need access at various times. If I want to keep the app on the server, is TS the only route that I have????
