Hi All.

We just deployed two SBS2003 Premium installations (one in Jamaica, the other in Canada) for a client. Both are running ISA2000, and RWW with full time broadband.

Does anyone know of a 'voice chat' solution that will work with IS2000? I am not really looking for a VOIP solution (too costly), but more of a pc to pc solution.

I have been researching using netmeeting clients and the H.323 gateway, but can't find any good white papers or 'how to's'.

Any help would be appreciated, as paying \$2/min to the telephone company isn't a option!

Thanks.
