With your help (thanks) and many hour of a steep learn curve I have 10 clients up and running on SBS 2003.

Two small problems, so far, I still can't figure out.

1. Several computers won't reconnect automatically to mapped network drives at

reboot. I have check reconnet at logon. Have to browse to network drive in

windows explorer and type in user name and password.

2. Two out of ten client can't access <http://companyweb.default.aspx>. Is there a

link to this in the client apps on the serve? If so, where is it? Any suggestions?

I've look through past posting and the knowledge base and can't find any help there.

Thanks agin for your help over the last few days.

David
